

Executive Summary

HNDL Risk
Harvest Now, Decrypt
Later

CRQC Risk
Quantum Computer
Threat

Migration Urgency
Action Required

Organization Profile

Industry	Finance & Banking
Region	United Kingdom
Organization Size	Startup (< 50 employees)
Regulatory Framework	FCA / PRA (UK Finance)
Data Types	Financial Records, PII (Personally Identifiable Information)
Current Cryptography	RSA-4096 (Standard), AES-128 (Symmetric)

Harvest Now, Decrypt Later (HNDL)

Your organization processes financial records with long-term sensitivity. Adversaries may be harvesting encrypted data now for future decryption.

Affected Systems:

- Customer databases
- Transaction logs
- Identity records

Cryptographically Relevant Quantum Computer (CRQC)

Current RSA and symmetric implementations will be vulnerable when CRQCs become available, estimated within 5-10 years.

Affected Systems:

- TLS/SSL communications
- Digital signatures
- Key exchange protocols

Strategic Recommendations

CRITICAL

Immediate PQC Assessment

Conduct an immediate assessment of all quantum-vulnerable cryptographic systems, focusing on RSA and ECC implementations.

HIGH

Migration Roadmap

Develop a comprehensive post-quantum cryptography (PQC) migration plan with defined milestones and resource allocation.

HIGH

Data Classification

Classify sensitive data by longevity requirements to prioritize protection against Harvest Now, Decrypt Later attacks.

MEDIUM

Vendor Coordination

Engage with technology vendors to understand their PQC roadmaps and ensure alignment with your migration timeline.

Dytallix

Open-source, quantum-secure, and built for the future. NIST-standardized cryptography meets developer-first tooling.
